ADSS Cyber Security partnered with Comodo to transition from a Managed Service Provider (MSP) to a Managed Security Service Provider (MSSP).

ADSS Cyber Security chose Comodo’s Dragon Platform with Advanced Endpoint Protection (AEP), which is a patented auto containment technology with active breach protection that neutralizes ransomware, malware, and cyber-attacks.

“Our customers shouldn’t have to worry about cyber threats and so our mission is to provide the most advanced security tools operated by a highly trained staff. To accomplish this, we partner exclusively with global leaders in the security industry, like Comodo,” states Christopher Phillips, Co-Founder & Director of Cyber Operations at ADSS Cybersecurity.
“To successfully transition to an MSSP, we needed to provide the most solid security solutions available. We researched multiple security firms such as CrowdStrike and F-Secure and found that they didn’t offer protection that was equal to Comodo. After numerous tests, Comodo’s Dragon platform was the only solution that came out on top, and even when we tried to trick the software, it still offered great protection,” says Phillips.

One of the main reasons ADSS Cyber Security chose Comodo was because of its next-gen SOC-as-a-platform (SOCaaSP). Comodo’s SOC-as-a-Platform gives the company complete visibility over its clients’ IT estates which has enabled them to offer next-level protection. It saves the company’s partners time and money, without zero capital outlay. Additionally, the quick turnaround Comodo helped ADSS to build its solution stack quickly and successfully.

“Comodo made it incredibly easy for us to add managed security services to our portfolio. Without Comodo, we would have had needed substantial capital investment for staff, software, and infrastructure,” commented Phillips.

Another reason the team at ADSS Cyber Security chose Comodo was because of its auto containment and threat detection feature. The auto containment runs an unknown executable in a kernel API virtualized mode, thereby offering attack surface reduction (ASR), which neutralizes ransomware attacks. Additionally, Comodo’s AEP utilizes a Default Deny Platform to provide complete protection against zero-day threats while having no impact on end-user experience or workflows. Lastly, Comodo’s Valkyrie gives a trusted verdict on all files related to ransomware phishing and malware.

“We initially chose to work with Comodo because of the incredible auto containment technology, but we’re benefiting from the entire platform of security solutions, which enabled us to offer streamlined and extensive protection for our clients. We feel safe knowing that our clients are protected by the best,” revealed Phillips.

Comodo’s platform shares intelligence and is, therefore, more secure than disparate products that claim to be the best of the breed but don’t share information. Comodo has architected its cybersecurity product to maximize intelligent sharing between every component of the platform, therefore providing superior security.

According to Alan Knepfer, President and Chief Revenue Officer at Comodo, “We’re ready to help companies meet the explosive demand for managed security services. Our platform makes it possible for an MSP to become an MSSP with one click and with zero capital outlay.”
